Danil Grantsev

Junior Security Analyst (SOC L1) · Blue Team

Vietnam (UTC+7) · Open to remote · malooyy6@gmail.com · t.me/rezzodan · github.com/Rezzodan/Portfolio

SUMMARY

Security-focused engineer with **2.5 years of hands-on production experience** running a fintech platform end-to-end: Linux servers, Docker, reverse proxy and TLS, mail infrastructure, and incident troubleshooting under real pressure. Building SOC skills in a home lab (Wazuh SIEM, Suricata IDS, Wireshark, tcpdump) and through the Google Cybersecurity Certificate. Looking for a SOC L1 or junior security analyst role.

SECURITY LAB & PROJECTS

- **SIEM (Wazuh):** deployed manager, indexer and dashboard in Docker, connected an agent and ingested web server access logs of a vulnerable test app (DVWA); triaged XSS alerts. Found that default rules missed boolean SQL injection (`' OR '1'='1`), wrote a custom rule and validated it in `wazuh-logtest` with no false positives on lab logs.
- **IDS (Suricata):** installed and configured Suricata on a lab interface, generated test traffic and analyzed the resulting alerts.
- **Incident analysis (5 reports):** investigated packet captures and logs with tcpdump and Wireshark — SYN flood DoS, ICMP flood (NIST CSF), DNS outage, malicious redirect after brute force; wrote stakeholder-ready reports with root cause and remediation.
- **Detection automation (Python):** SSH brute-force monitor that parses auth logs, aggregates failures per user and IP, enriches with GeoIP and alerts to Telegram above a threshold; unit tests and GitHub Actions CI.
- **Security audit:** controls and compliance assessment of a fictional retailer against NIST CSF, PCI DSS, GDPR and SOC 2, with a prioritized remediation plan.
- **Recon & traffic:** full-port Nmap scan with a Python XML report parser; captured FTP traffic to show plaintext credentials and recommended SFTP/SSH.

EXPERIENCE

Full-Stack Developer (Platform & Infrastructure) — LLC "100KVADRATOV" **Mar 2024 – Present**

Fintech / credit-consulting company · Ufa, Russia · remote

- Operated production for **7 services** on a self-hosted Linux server: Docker Compose, Traefik reverse proxy with HTTPS, PostgreSQL, self-hosted mail; owned deploys, reboot recovery, database backups and runbooks.
- Investigated and resolved **7+ production incidents** end-to-end, e.g. a mail outage after reboot caused by a port 25 conflict between host Postfix and the mail container, and Gmail 550 rejections traced to IP reputation rather than SPF/DKIM.
- Protected client personal data: PII masking in logs, HMAC-signed webhook callbacks, JWT-authenticated APIs, and no client data in screenshots, docs or public artifacts.
- Added allowlist guards checked before any download or CRM write, so automation could not corrupt deals in the wrong pipelines; fixed a webhook logic flaw that caused duplicate partner payouts on installment deals.
- Built the platform itself: ASP.NET Core API, React apps for Telegram/MAX, Python services (FastAPI, Django) for lawyers, partners and credit-bureau report processing.

SKILLS

Security: SIEM (Wazuh), IDS (Suricata), Wireshark, tcpdump, Nmap, log analysis, incident reporting, NIST CSF, MITRE ATT&CK (basics), OWASP Top 10

Systems: Linux (Kali, Ubuntu), Bash, Docker, Traefik / TLS, DNS, SMTP / SPF / DKIM, PostgreSQL

Programming: Python, C# (ASP.NET Core), TypeScript / React, SQL

Languages: Russian (native), English (A2, improving)

CERTIFICATIONS & EDUCATION

- **Google Cybersecurity Professional Certificate** (Coursera) — in progress, 3 of 8 courses completed
- **C Programming Fundamentals** — Stepik, 2025
- **Bashkir College of Economics and Law** — Banking and Financial Services, 2017 – 2019
